Stream Gage Descriptions and Streamflow Statistics for Sites in the Tigris River and Euphrates River Basins, Iraq

By Dina K. Saleh

Abstract

Statistical summaries of streamflow data for all long-term streamflow-gaging stations in the Tigris River and Euphrates River Basins in Iraq are presented in this report. The summaries for each streamflow-gaging station include (1) a station description, (2) a graph showing annual mean discharge for the period of record, (3) a table of extremes and statistics for monthly and annual mean discharge, (4) a graph showing monthly maximum, minimum, and mean discharge, (5) a table of monthly and annual mean discharges for the period of record, (6) a graph showing annual flow duration, (7) a table of monthly and annual flow duration, (8) a table of high-flow frequency data (maximum mean discharge for 3-, 7-, 15-, and 30-day periods for selected exceedance probabilities), and (9) a table of low-flow frequency data (minimum mean discharge for 3-, 7-, 15-, 30-, 60-, 90-, and 183-day periods for selected non-exceedance probabilities).

Introduction

Unlike other Middle East countries, Iraq has generous water resources originating in the upper drainage basins of the Tigris and Euphrates Rivers in Iraq and its neighboring countries of Turkey, Iran, and Syria. These water resources coupled with good riparian soils have resulted in an agriculturally centered population in Iraq. According to the U.S. Department of Agriculture (USDA), agriculture is the second largest component of Iraq's gross domestic product (GDP) and an important part of the social structure of rural communities (U.S. Department of Agriculture, 2009). About 60 percent of arable land in Iraq is under cultivation and one-fourth of the entire Iraqi workforce is employed in the agricultural sector (U.S. Department of Agriculture, 2009). Although the natural water resources generally are sufficient, Iraq still imports the vast majority of its foodstuffs because of inefficient and, in some cases, environmentally harmful farming practices (Food and Agriculture Organization of the United Nations, 2010). Thus, support and development of the agricultural sector in Iraq is critical for improving economic stability. The strong connection between water resources and agricultural production and improved decision support systems for managing water resources could enable the agricultural

sector to develop beyond its current status. This development in turn could lead to increased job opportunities and a reduction in Iraq's current need for importing foodstuffs.

Water supplies from the Tigris and Euphrates Rivers have decreased significantly over the past several decades (Ministry of Irrigation, 1958, 1959, and 1976). This decreasing trend is expected to continue as a result of upstream development in Turkey, Syria, and Iran, as well as the possible effects of climate change and increased drought periods on regional hydrology. As these traditional sources of water in Iraq decrease, use of the remaining resource will need to be optimized and new sources of water will need to be developed. Methods for optimizing existing water resources include the development of decision support systems that take advantage of accurate and real-time hydrologic data. Because some water supplies in Iraq originate in high elevation mountainous areas in Turkey, Iran, and Iraq, developing methods to estimate the snowpack in a given year and to forecast runoff would allow better management of dams and reservoirs in Iraq as facility operators balance demands for irrigation water with hydroelectric generation and flood control concerns. A system that predicts runoff and provides real-time information on inflows, outflows, and water quality from Iraq's complex system of dams, barrages, and irrigation canals would optimize the utilization of surface waters for agricultural needs, hydroelectric generation, and public water supplies.

Knowledge of the magnitude and time distribution of streamflow is essential for all aspects of water management and environmental planning. Agencies responsible for the development and management of Iraq's surface-water resources can use this knowledge for making safe, economical, and environmentally sound water-resource planning decisions. To provide the Iraqi managers with necessary streamflow information, the U.S. Geological Survey, in cooperation with the Ministry of Water Resources (MoWR) and Ministry of Agriculture Water Resources (MoAWR) under the auspices of the U.S. Department of Defense, Task Force for Business and Stability Operations, computed streamflow statistics for data collected at long-term streamflow-gaging stations in the Tigris River and Euphrates River Basins.

The purpose of this report is to provide summaries of streamflow characteristics for all long-term streamflow-gaging stations in the Tigris River and Euphrates River Basins. The long-term streamflow-gaging stations used in this report are listed in table 1 and the locations are shown in figure 1.

Figure 1. Locations of streamflow-gaging stations for which streamflow statistics are published in this report, Tigris River and Euphrates River Basins, Iraq. Site location information is unavailable for site T6.

History of Streamflow-Gaging Station Program

Daily streamflow data were provided by the Ministry of Irrigation (1958, 1959, and 1976) of the Government of Iraq. Most of the data available from 1959 to 2005 were based on recorded gage heights at or near river staff gages on the riverbank, mounted either on a post or on bridge piers or on masonry steps constructed specifically for this purpose. Periodic measurements of stream discharge were used to develop rating curves or tables that were used to convert recorded gage heights to discharge. Prior to 1959, measuring facilities varied from station to station and included cableways, boats, and bridges. Discharge measurements generally were made at 10-m intervals across the stream, at 0.5-m water depth, taking about 3 minutes to measure at each 10-m interval. At the smaller rivers, the interval was reduced to less than 10 m. The spacing of vertical sections generally resulted in about 20 sections at medium and high stages; however, at low stages, the number of sections was reduced, sometimes as low as 10 sections. A coefficient of 0.98 was applied to the observed velocity to obtain the mean in the vertical (Ministry of Irrigation, 1958, 1959, and 1976). The frequency of discharge measurements made varied at each station and depended on factors such as the stability of the channel and the accessibility of the station.

Streamflow-Gaging Station Summaries

Streamflow-gaging station summaries are presented so that each station description and tables of streamflow statistics and probabilities of occurrence are presented in the same order and format for each streamflow-gaging station. The order of presentation is as follows:

1. Station description (information provided by the Ministry of Irrigation of the Government of Iraq),
2. Graph showing the annual mean discharge for the period of record,
3. Table of extremes and statistics of monthly and annual mean discharges,
4. Graph showing monthly discharge (maximum, minimum, and mean discharge),
5. Table of monthly and annual mean discharges for the period of record,
6. Graph showing the annual flow duration,
7. Table of monthly and annual flow duration,
8. Table of exceedance probability of maximum mean discharge for selected numbers of consecutive days,
9. Table of non-exceedance probability of minimum mean discharge for selected numbers of consecutive days.

Station Descriptions

The station description for each streamflow-gaging station provide descriptive information, such as station location, gage information, general description of records, period of record, and drainage area when available. This information is compiled from records maintained by Ministry of Irrigation of the Government of Iraq. The following comments clarify information presented under the various headings of the station manuscript.

LOCATION: Information about the location of the streamflow-gaging station primarily is limited to latitude and longitude.

DRAINAGE AREA: Drainage area was obtained from data reports provided by the Iraqi government.

PERIOD OF RECORD: The period of record is the period for which published records for the streamflow-gaging station are available.

GAGE: The type of gage in use during this reporting period, the datum of the gage refers to a standard datum, and general description of the method used to measure discharge.

RECORD: The quality of the discharge measurement is explained.

Methods

Statistics of Monthly and Annual Mean Data

Statistics of monthly and annual mean discharges presented for each gaging station include (1) the maximum, minimum, and mean monthly discharges and (2) the maximum, minimum, and mean annual discharges. The water years in which the maximum (October 1 through September 30) and minimum discharges (April 1 through March 31) occurred are listed with the respective values, and the standard deviation and coefficient of variation of the monthly and annual mean discharges are listed with the respective values. The percentage of the annual discharge that occurs each month is listed in the table for each station.

The method for computing the monthly and annual mean discharges can be illustrated by using the data for one of the gaging stations, Tigris River at Baghdad (IRQ_T18), as an example. Each monthly mean is the mean of the daily values for that month. Months or years for which all daily values are not available are not included in the compilation of statistics. The maximum monthly mean discharge is the maximum value of all monthly mean values for a given month for the period of record. For example, the maximum mean value

during October for the Tigris River at Baghdad (IRQ_T18) is 1,685.0 m³/s (water year 1989). Similarly, the minimum monthly mean discharge is the minimum value of all monthly mean values. The minimum mean value during October for the Tigris River at Baghdad (IRQ_T18) is 180.50 m³/s (water year 1956). The maximum and minimum monthly mean values can be found in the statistics of the monthly and annual mean discharges table or by searching the monthly and annual mean discharges tables for each station. The mean monthly discharge is the mean of all the monthly mean discharges for a given month for the period of record, and the standard deviation is a measure of the variability of the values. The mean monthly discharge for the Tigris River at Baghdad (IRQ_T18) is 411.35 m³/s for October, and the standard deviation is 234.52 m³/s. The mean monthly discharge for October is the same as the mean of all October daily values for the period of record used. The coefficient of variation is the ratio of the standard deviation to the mean. The coefficient of variation is a dimensionless measure of the spread of the values. Because monthly mean discharges are much greater in spring than in winter, the standard deviations also are much greater in spring than in winter. Using the coefficient of variation tends to equalize the measure of spread of values for all months so a more meaningful comparison among months can be made.

The percentage of the annual discharge is the percent of the annual discharge that occurred during each month. It is calculated by dividing the mean discharge for the month by the total of the 12 monthly mean discharges and multiplying by 100. Because of rounding of the monthly percentage, the sum of the 12 percentages may not equal 100 percent.

The maximum, minimum, and mean annual discharges are computed from the annual mean discharges for the period of record, using mathematical computations. The water years of occurrence of the maximum and minimum values are listed with the respective values, and the standard deviation of the mean of the annual mean values is listed with the mean value. The maximum annual mean discharge for the Tigris River at Baghdad (IRQ_T18) was 1,815.49 m³/s in 1954, and the minimum annual mean discharge was 393.14 m³/s in 2001. The mean annual discharge for the period of record is 1,019.73 m³/s.

Monthly and Annual Flow Duration

The monthly and annual flow duration table represents how frequently particular values of daily mean discharge were exceeded over the period of data collection. Flow duration data are computed by tabulating the number of daily mean discharge values that fall within pre-selected class limits, computing the percentage of values in each class, and interpolating discharge values for the percentages shown in the table. Monthly flow duration values are calculated from daily values in all complete months in the record, and annual figures

are calculated for all complete water years. For example, if the 90-percent flow duration value for October is 221.50 m³/s, then 90 percent of all October daily discharge values for the period of record are greater than 221.50 m³/s.

Probability of Occurrence of High or Low Discharges

High- and low-flow frequency data show the exceedance probability of maximum mean discharge and non-exceedance probability of minimum mean discharge computed over selected numbers of consecutive days. For example, an annual 3-day high flow is the largest value of mean discharge over any consecutive 3-day period during the water year. For high-flow frequency computations, the water year is selected to help ensure that the largest 3-day mean flow will not span two water years. Because high flows are uncommon in the September–October period, the water year used for high-flow frequency computations is October 1 through September 30. Likewise, an annual 15-day low flow is the smallest mean discharge for any consecutive 15-day period during a water year. Because low flows are uncommon during the spring, the water year for low-flow frequency computations is April 1 through March 31.

The exceedance probabilities of annual high flows and the non-exceedance probabilities of annual low flows are determined by fitting a log Pearson Type 3 probability distribution to the annual high- or low-flow series. The high-flow series used for this study were the annual 3-, 7-, 15-, and 30-day maximum discharges, and the low-flow series were the annual 3-, 7-, 15-, 30-, 60-, 90-, and 183-day minimum discharges. Exceedance probabilities were used to characterize the high-flow data, and non-exceedance probabilities (1 minus exceedance probability) were used to characterize the low-flow data. On this basis, small exceedance probabilities are associated with large (rare) maximum discharges, and small non-exceedance probabilities are associated with small (rare) minimum discharges. Recurrence interval, which is the average length of time between exceedance of a high flow and non-exceedance of a low flow, is another way of expressing annual exceedance or non-exceedance probability. Recurrence interval is the reciprocal of exceedance or non-exceedance probability. Thus, for example, a 3-day high flow with an annual exceedance probability of 0.10 has a 10-percent chance of being exceeded in a given year and has a recurrence interval of 10 years.

Although high- and low-flow frequency are both affected by the watershed changes and processes, low-flow frequency particularly is sensitive to natural-channel processes, such as evapotranspiration, and human-induced hydrologic modifications, such as the operation of many small water-storage reservoirs; the effects of surface-water withdrawal for agricultural, municipal, and industrial use; and the effects of return flow to the river.

Stream-Gage Descriptions and Streamflow Statistics

Tigris River Basin

TIGRIS RIVER AT PAISH KHBUR-TUSAN (IRQ_T1)

(U.S. Geological Survey identification number: 37040004223000)

LOCATION: Latitude 37° 04' 00" N, Longitude 42° 23' 00" E.

DRAINAGE AREA: 46,700 square kilometers.

PERIOD OF RECORD: January 1958 to September 1975.

GAGE: Gage is located on the left bank immediately downstream of Paish Khabur village. The automatic water stage recorder and the staff gage are on the right bank at the Tusan station. A correction of 324.76 meters must be added to the gage reading to convert to GTS datum. The streamflow-gaging station was moved in 1957 to Tusan, 8 km downstream of the Paish Khabur Station. Tusan is located at Latitude 37° 04' 00" N, Longitude 42° 28' 00" E.

RECORDS: Discharge measurements were made at Tusan from a cableway.

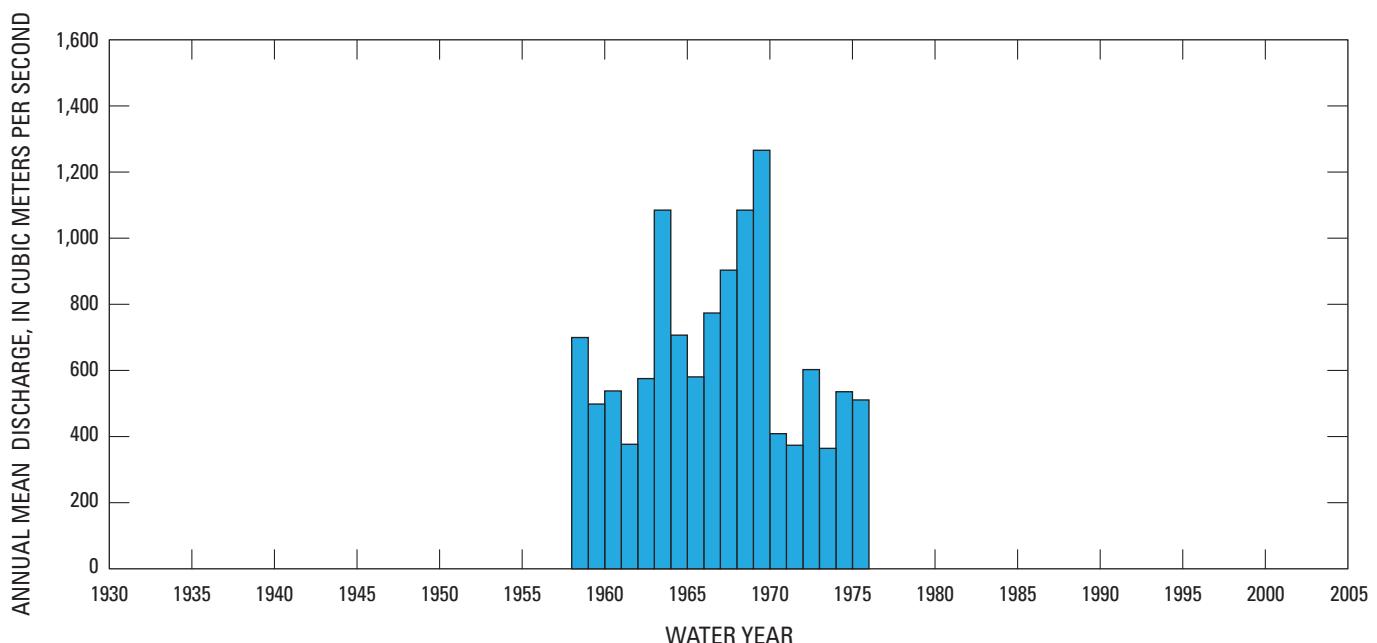

Figure 2. Annual mean discharge at streamflow-gaging station IRQ-T1, Tigris River at Paish Khabur-Tusan, Iraq, water years 1958–75.

Tigris River Basin

KHABUR RIVER AT ZAKHO (IRQ-T2)

(U.S. Geological Survey identification number: 37080004241000)

LOCATION: Latitude 37° 08' 00" N, Longitude 42° 41' 00" E.

DRAINAGE AREA: 3,500 square kilometers.

PERIOD OF RECORD: November 1958 to September 1989.

GAGE: The staff gage is located on the left bank about 500 meters upstream of the Abbasid Bridge. The automatic water stage recorder installed near the staff was damaged in 1962. The auxiliary staff gage is downstream at the Power House Bridge, which is at the head of the left of the two channels round the town of Zakho. Each gage is set to an arbitrary datum.

RECORDS: Daily discharge records are excellent until 1962 and good for the rest of the period. Discharge measurements had been made regularly until March 1962 at the recorder site from a cableway or by wading; very few observations were made after March 1962.

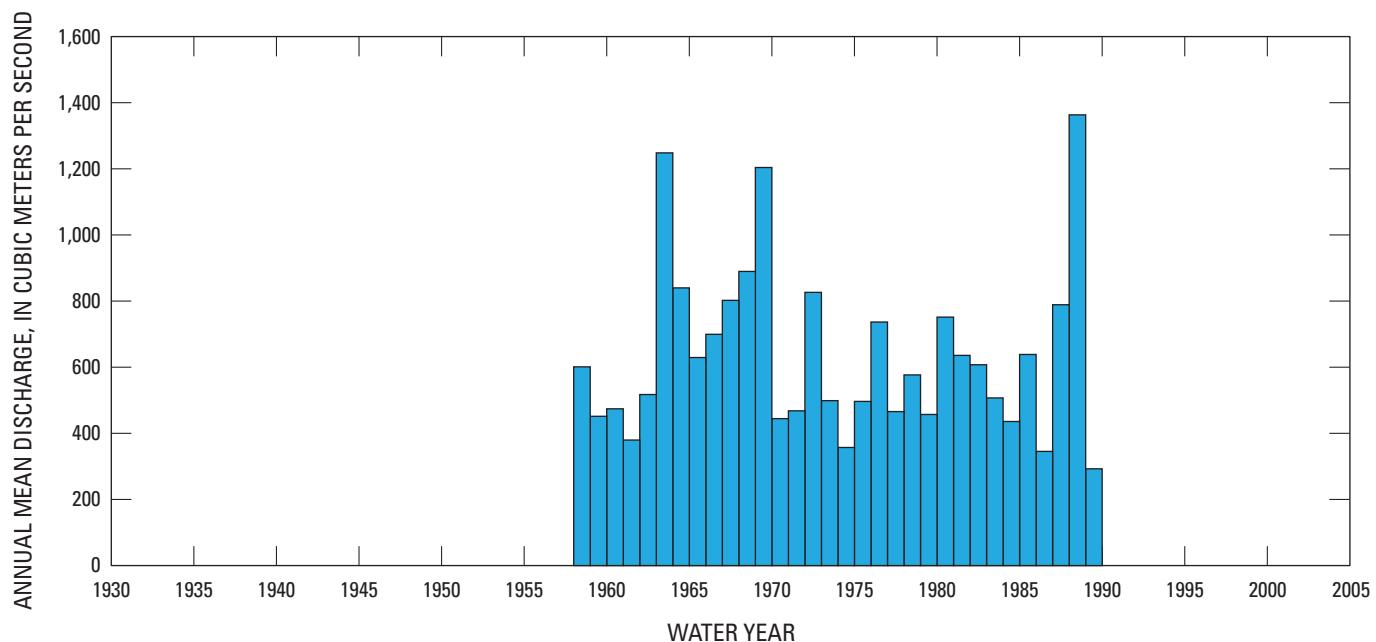

Figure 5. Annual mean discharge at streamflow-gaging station IRQ_T2, Tigris River, Khabur River at Zakho, Iraq, water years 1958–89.

Table 7. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T2, Khabur River at Zakho, Iraq, water years 1958–89.

Tigris River Basin

TIGRIS RIVER AT MOSUL (IRQ_T3)

(U.S. Geological Survey identification number:36375704249030)

LOCATION: Latitude 36° 37' 57" N, Longitude 42° 49' 03" E.

DRAINAGE AREA: 54,900 square kilometers.

PERIOD OF RECORD: October 1931 to August 1997.

GAGE: The staff gage is located on the right bank of the Tigris River, 40 meters upstream of the old bridge. The gage is set to GTS datum.

RECORDS: Discharge measurements are complete. Discharge measurements were taken regularly from the old bridge.

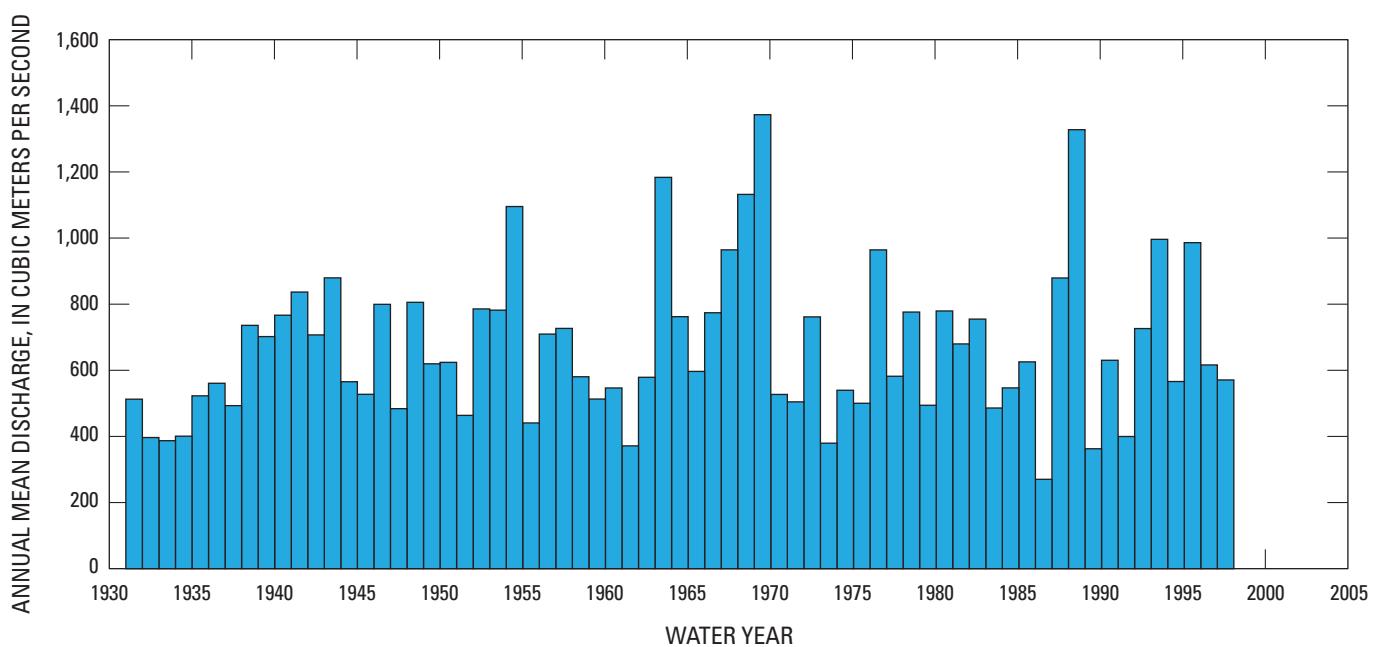

Figure 8. Annual mean discharge at streamflow-gaging station IRQ_T3, Tigris River at Mosul, Iraq, water years 1931–97.

Table 12. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T3, Tigris River at Mosul, Iraq, water years 1931–97.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics			
	Discharge (m ³ /s)	Water year of occurrence	Discharge (m ³ /s)	Water year of occurrence	Mean Discharge (m ³ /s)	Standard deviation (m ³ /s)	Coefficient of variation	Percentage of annual discharge

Tigris River Basin

RAWANDUZ RIVER AT JINDIAN (IRQ_T4)

(U.S. Geological Survey identification number: 36380004434000)

LOCATION: Latitude 36° 38' 00" N, Longitude 44° 34' 00" E.

DRAINAGE AREA: 1,160 square kilometers.

PERIOD OF RECORD: February 1957 to September 1975.

GAGE: The staff gage is fixed inside the well of the automatic water-stage recorder on the right bank of the Rawanduz River. An auxiliary external staff gage consisting of a standard gage plate attached to a timber backboard mounted on a 2-inch galvanized pipe set in concrete also is on the right bank. Gage height is set to an arbitrary datum.

RECORDS: Discharge measurements were made regularly until January 1965 from a cableway or by wading. Records show missing discharge data because of damage to gage during 1965 to 1970 time periods.

Tigris River Basin

BALIKIAN RIVER AT BALIKIAN (IRQ_T5)

(U.S. Geological Survey identification number:36390004430000)

LOCATION: Latitude 36° 39' 00" N, Longitude 44° 30' 00" E.

DRAINAGE AREA: 1,060 square kilometers.

PERIOD OF RECORD: April 1958 to March 1974.

GAGE: The staff gage is located on the left bank of the Balikian River, 400 meters upstream of the Balikian Road Bridge and about 3 meters upstream of the confluence of the Balikian and Ruwanduz Rivers. The gage was damaged on March 30, 1974; therefore, data are not available after March 30, 1974.

RECORDS: Discharge measurements were made regularly until January 1965 from a cableway or by wading. Only a few measurements were made after January 1965.

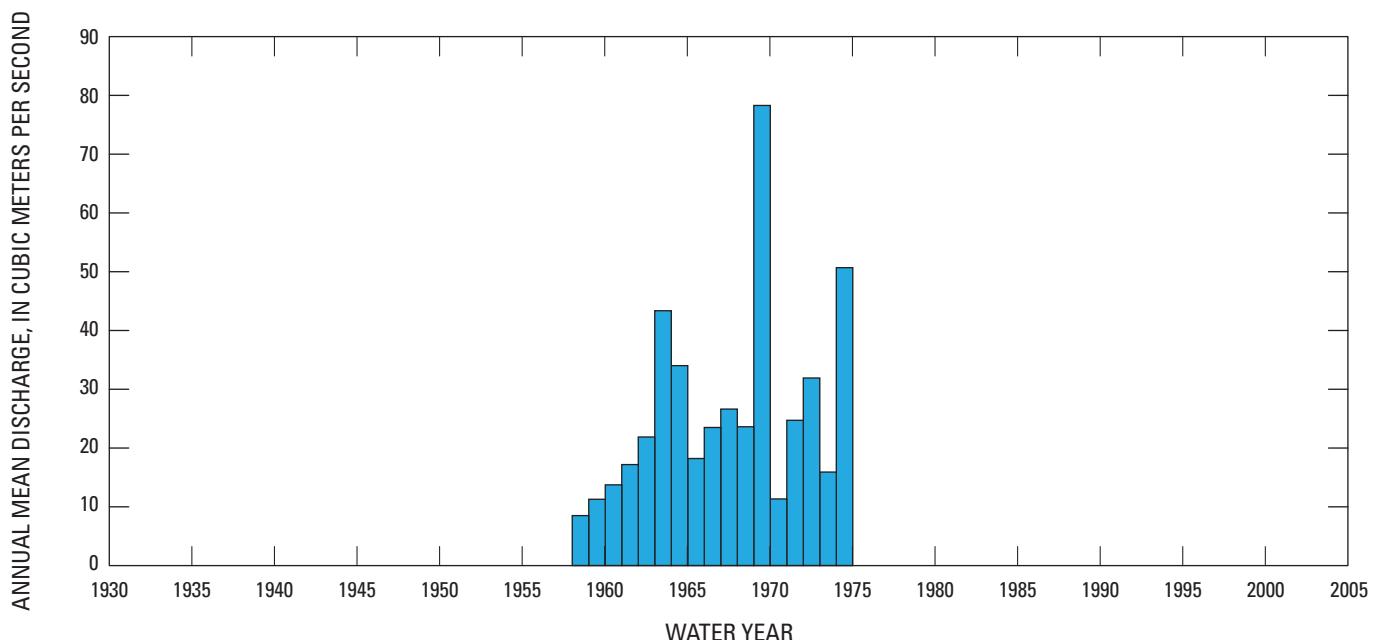

Figure 14. Annual mean discharge at streamflow-gaging station IRQ_T5, Balikian River at Balikian, Iraq, water years 1958–74.

Tigris River Basin

GREATER ZAB RIVER AT BEKHME DAM-IMRP (IRQ_T7)

(U.S. Geological Survey identification number:36382904429420)

LOCATION: Latitude 36° 38' 29" N, Longitude 44° 29' 42" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: November 1931 to September 2004.

GAGE: No information available for this site.

RECORDS: No information available for this site.

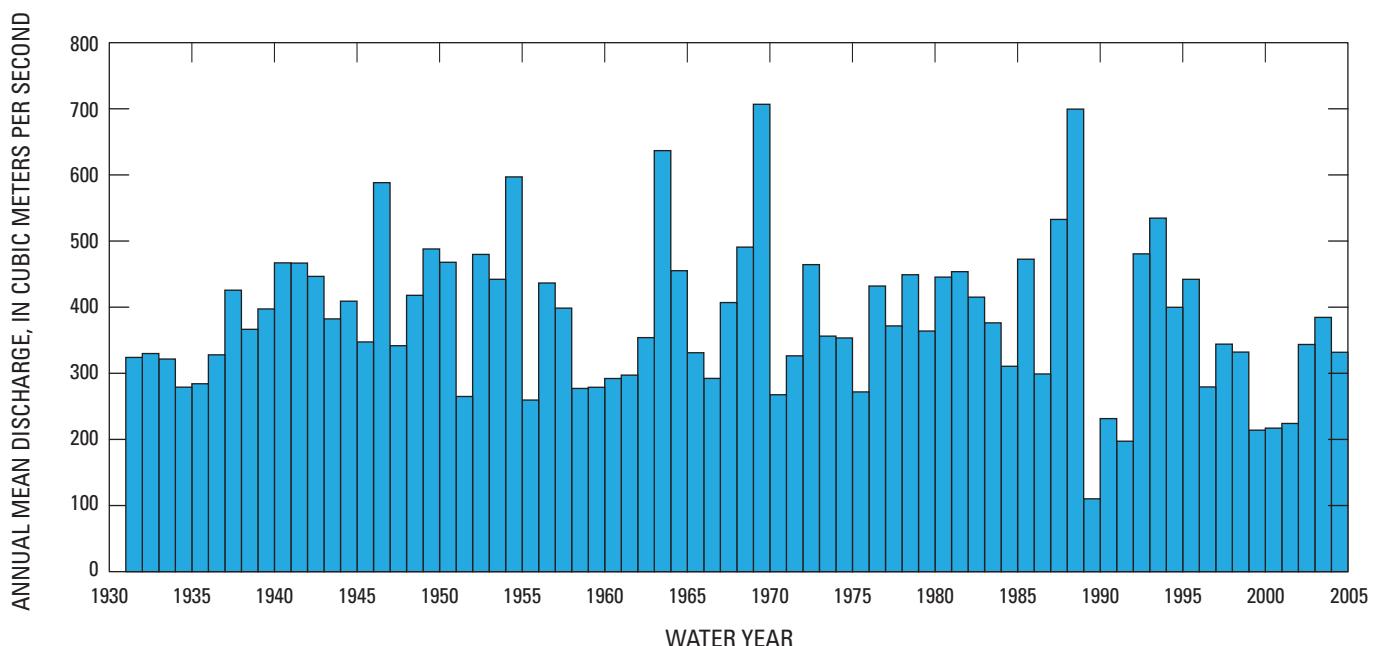

Figure 20. Annual mean discharge at streamflow-gaging station IRQ_T7, Greater Zab River at Bekhme Dam-IMRP, Iraq, water years 1931–2004.

Table 32. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T7, Greater Zab River at Bekhme Dam-IMRP, Iraq, water years 1931–2004.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics			
	Discharge (m ³ /s)	Water year of occurrence	Discharge (m ³ /s)	Water year of occurrence	Mean discharge (m ³ /s)	Standard deviation (m ³ /s)	Coefficient of variation	Percentage of annual discharge

Tigris River Basin

KHAZIR RIVER AT MANQUBA (IRQ_T8)

(U.S. Geological Survey identification number:36180004333000)

LOCATION: Latitude 36° 18' 00" N, Longitude 43° 33' 00" E.

DRAINAGE AREA: 2,900 square kilometers.

PERIOD OF RECORD: February 1943 to July 1994.

GAGE: The staff gage is fixed to the downstream side of the left pier of the former bridge, except for the lowest part of the gage, which is fixed to an upright steel beam 2 meters away. The gage is set to GTS datum.

RECORDS: Discharge records are complete. Starting in 1961, discharge measurements were taken from the bridge or by wading and from a cableway.

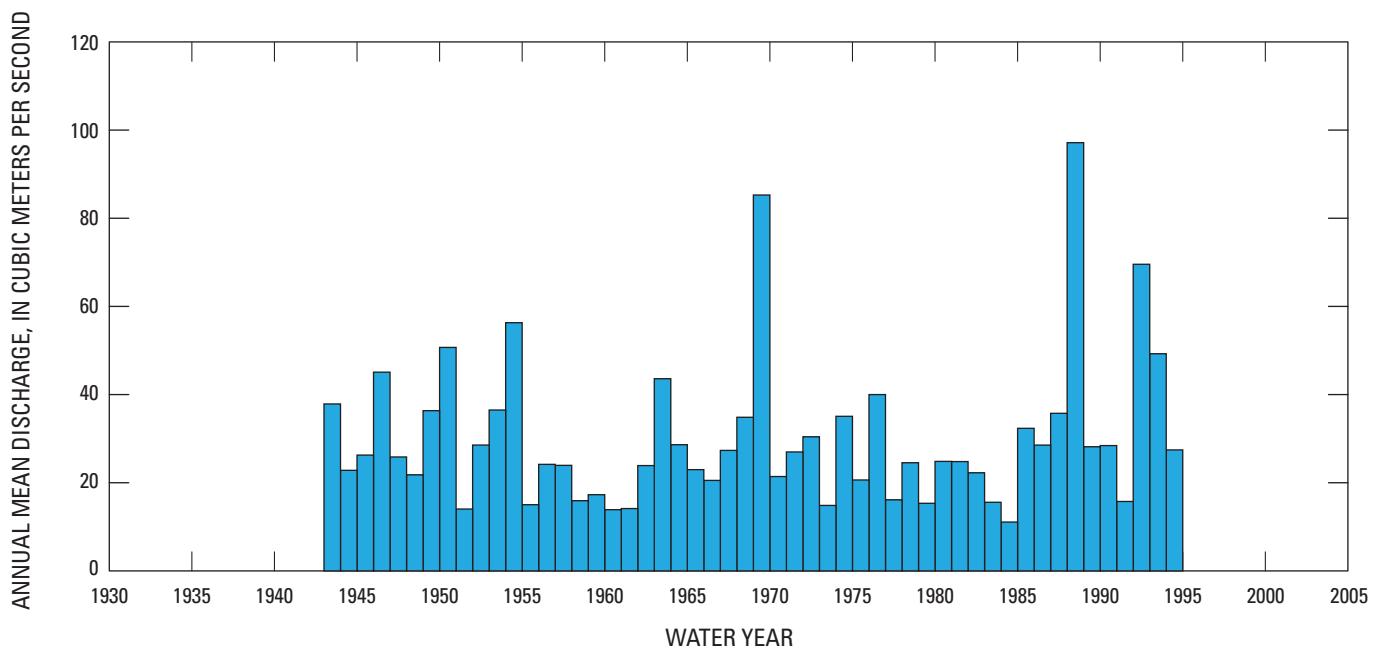

Figure 23. Annual mean discharge at streamflow-gaging station IRQ_T8, Khazir River at Manquba, Iraq, water years 1943–94.

Table 37. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T8, Khazir River at Manquba, Iraq, water years 1943–94.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics

Tigris River Basin

GREATER ZAB RIVER AT ESKI KELEK (IRQ_T9)

(U.S. Geological Survey identification number:36160004339000)

LOCATION: Latitude 36° 16' 00" N, Longitude 43° 39' 00" E.

DRAINAGE AREA: 20,500 square kilometers.

PERIOD OF RECORD: January 1932 to September 1990.

GAGE: The staff gage is attached to the downstream right side of the steel bridge, except for the lowest part of the gage, which is fixed to a concrete step. The gage is set to GTS datum.

RECORDS: Discharge records are missing data from October 1935 to September 1937. Discharge measurements were made from the bridge at Eski Kelek.

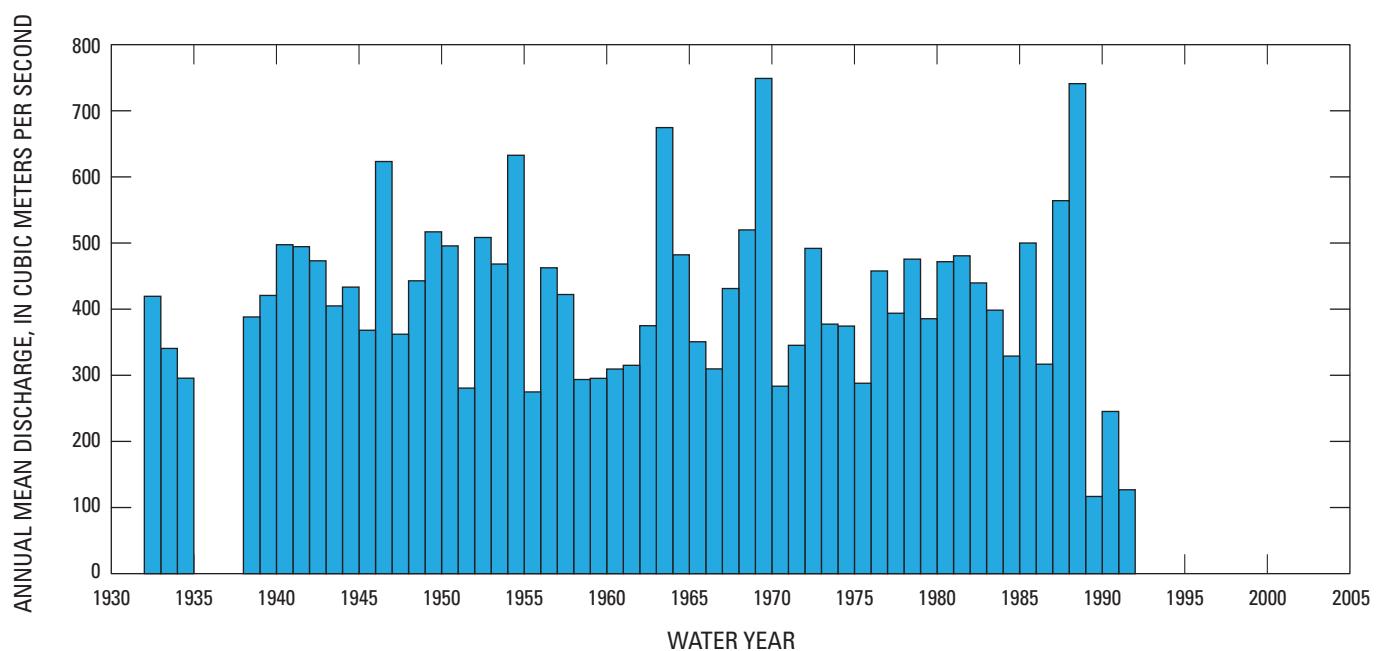

Figure 26. Annual mean discharge at streamflow-gaging station IRQ_T9, Greater Zab River at Eski Kelek, Iraq, water years 1932–90.

Tigris River Basin

LESSER ZAB RIVER AT DOKAN (IRQ_T10)

(U.S. Geological Survey identification number: 35571404457100)

LOCATION: Latitude 35° 57' 14" N, Longitude 44° 57' 10" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: November 1931 to September 2004.

GAGE: No information available for this site.

RECORDS: No information available for this site.

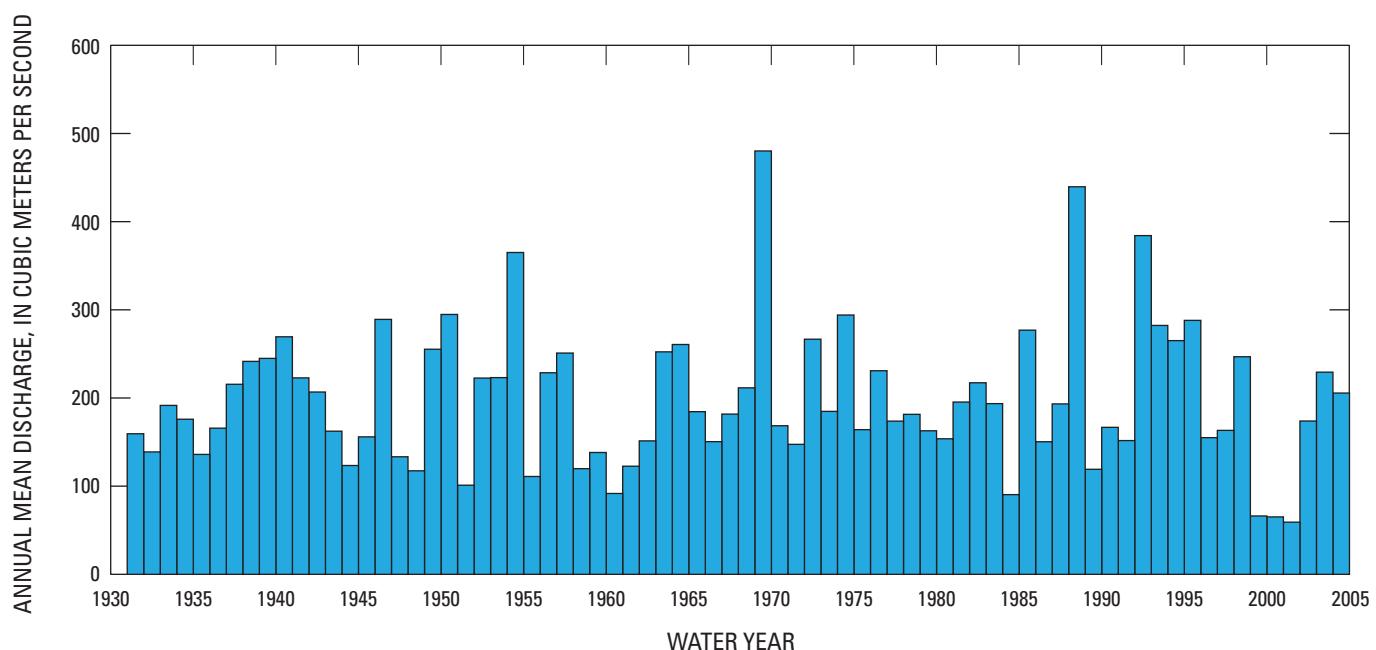

Figure 29. Annual mean discharge at streamflow-gaging station IRQ_T10, Lesser Zab River at Dokan, Iraq, water years 1931–2004.

Table 47. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T10, Lesser Zab River at Dokan, Iraq, water years 1931–2004.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics			
	Discharge (m ³ /s)	Water year of occurrence	Discharge (m ³ /s)	Water year of occurrence	Mean discharge (m ³ /s)	Standard deviation (m ³ /s)	Coefficient of variation	Percentage of annual discharge

Tigris River Basin

LESSER ZAB RIVER AT DOKAN VILLAGE (IRQ_T11)

(U.S. Geological Survey identification number: 35530004458000)

LOCATION: Latitude 35° 53' 00" N, Longitude 44° 58' 00" E.

DRAINAGE AREA: 11,700 square kilometers.

PERIOD OF RECORD: April 1952 to September 1975.

GAGE: The staff gage is located on the left bank of the Lesser Zab River 5 kilometers downstream of Dokan Dam. The automatic water-stage recorder is located on the left bank of the river 1 kilometer downstream of the staff gage. The gage is set to GTS datum.

RECORDS: Regular discharge measurements were made until 1962 from a cableway near the gage site. Starting on June 1, 1971, direct daily discharge measurements were taken directly from the outflow of Dokan Dam.

Tigris River Basin

LESSER ZAB RIVER AT ALTUN KUPRI-GOMA ZERDELA (IRQ_T12)

(U.S. Geological Survey identification number: 35454104408520)

LOCATION: Latitude 35° 45' 41" N, Longitude 44° 08' 52" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: October 1932 to May 1987.

GAGE: The staff gage is set to masonry steps immediately downstream of the left bank abutment of the highway bridge at the south branch of the river by the town of Altun Kupri. The gage is set to GTS datum.

RECORDS: Discharge measurements were made regularly from a cableway at Goma Zerdela.

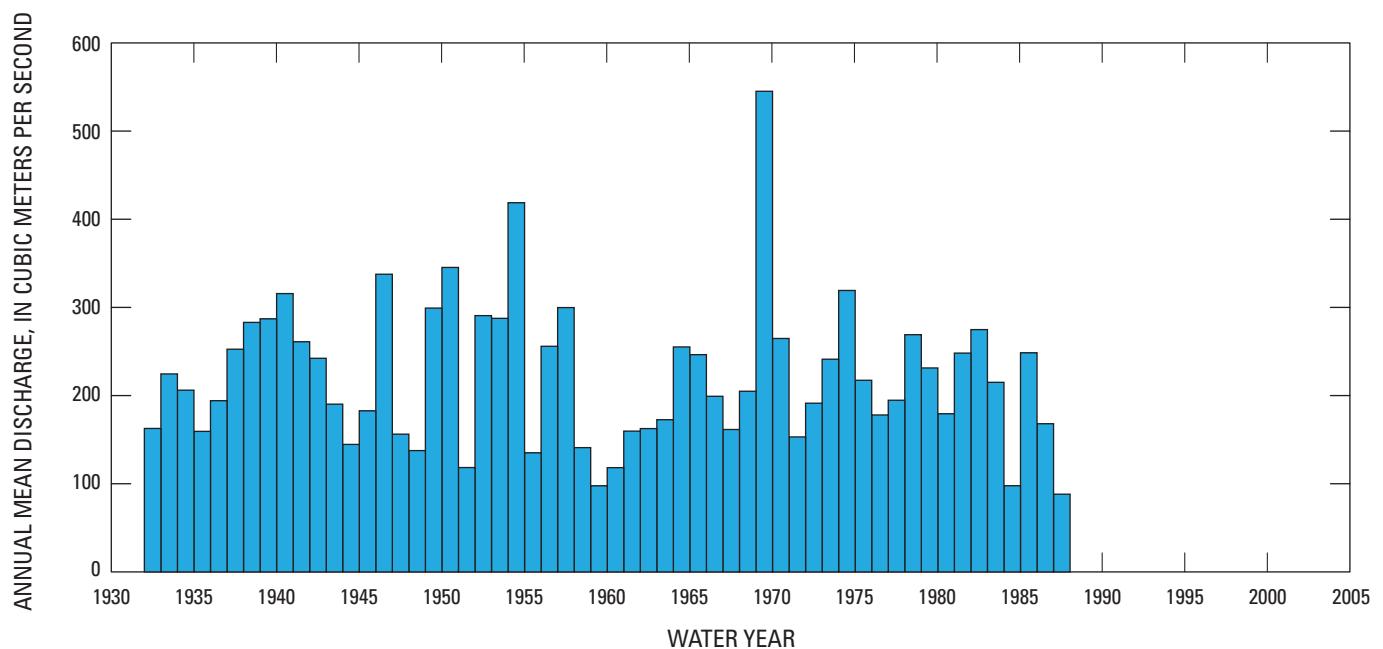

Figure 35. Annual mean discharge at streamflow-gaging station IRQ_T12, Lesser Zab River at Altun Kupri-Goma Zerdela, Iraq, water years 1932–87.

Table 57. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T12, Lesser Zab River at Altun Kupri-Goma Zerdela, Iraq, water years 1932–87.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics

Tigris River Basin

TIGRIS RIVER AT FATHA (IRQ_T13)

(U.S. Geological Survey identification number: 35030004333000)

LOCATION: Latitude 35° 03' 00" N, Longitude 43° 33' 00" E.

DRAINAGE AREA: 107,600 square kilometers.

PERIOD OF RECORD: March 1930 to September 1999.

GAGE: The staff gage is attached to the bank. The gage is set to an arbitrary datum.

RECORDS: Discharge measurements were being taken from a cableway until 1969. After 1969, the cableway was damaged and discharge measurements were made from the staff gage.

Tigris River Basin

TIGRIS RIVER AT BEIJI (IRQ_T14)

(U.S. Geological Survey identification number: 34554504329350)

LOCATION: Latitude 34° 55' 45" N, Longitude 43° 29' 35" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: April 1930 to March 2005.

GAGE: No information available for this site.

RECORDS: No information available for this site.

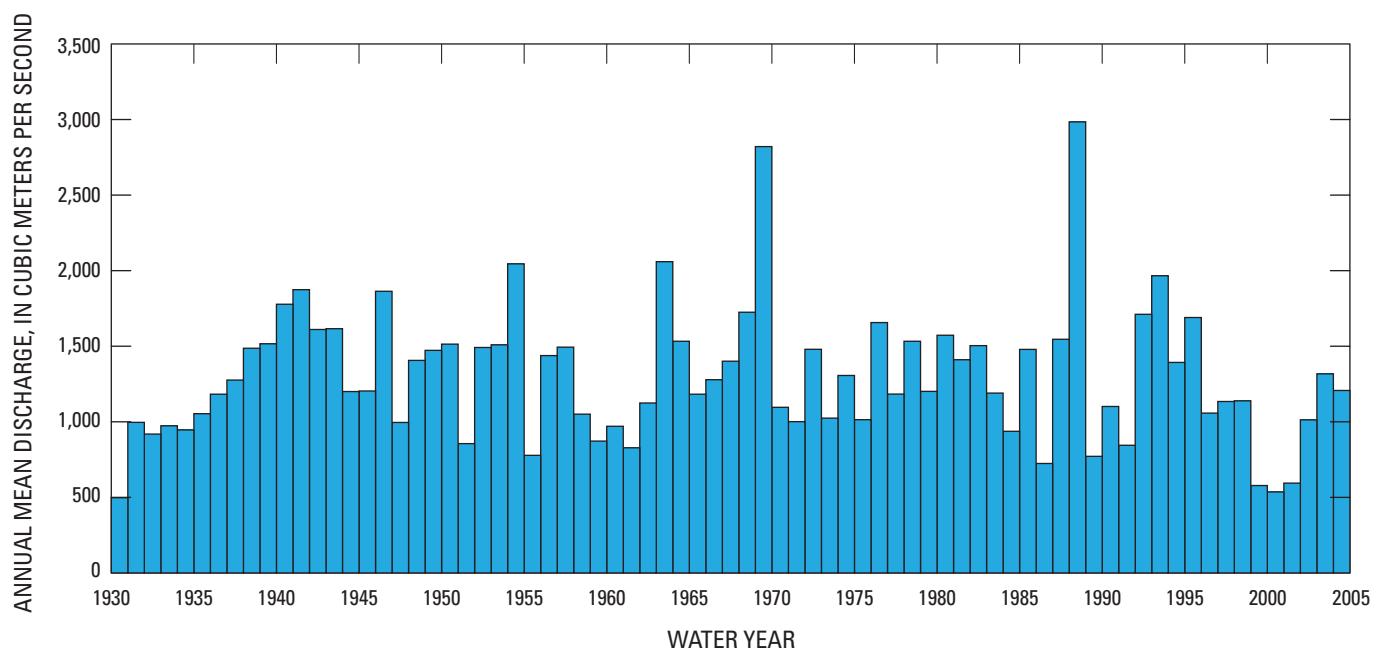

Figure 41. Annual mean discharge at streamflow-gaging station IRQ_T14, Tigris River at Beiji, Iraq, water years 1930–2005.

Table 67. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T14, Tigris River at Beiji, Iraq, water years 1930–2005.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics			
	Discharge (m ³ /s)	Water year of occurrence	Discharge (m ³ /s)	Water year of occurrence	Mean discharge (m ³ /s)	Standard deviation (m ³ /s)	Coefficient of variation	Percentage of annual discharge
October	1,377.00	1989	211.30	1931	536.28	234.05	0.44	3.42
November	1,877.00	1943	282.80	1935	674.90	277.61	0.41	4.31

Tigris River Basin

ADHAIM RIVER INJANA (IRQ_T15)

(U.S. Geological Survey identification number: 34300004431000)

LOCATION: Latitude 34° 30' 00" N, Longitude 44° 31' 00" E.

DRAINAGE AREA: 9,840 square kilometers.

PERIOD OF RECORD: October 1945 to September 1997.

GAGE: The automatic water-stage recorder and external staff gage are located on the left bank of the Adhaim River about 4 kilometers upstream of Injana. Gage heights were referred to an arbitrary datum until October 15, 1964, and after October 15, 1965, gage heights were referred to the GTS datum.

RECORDS: Discharge measurements were made regularly from a cableway or by wading except for the years 1967, 1968, 1971, and 1973. Discharge records are good.

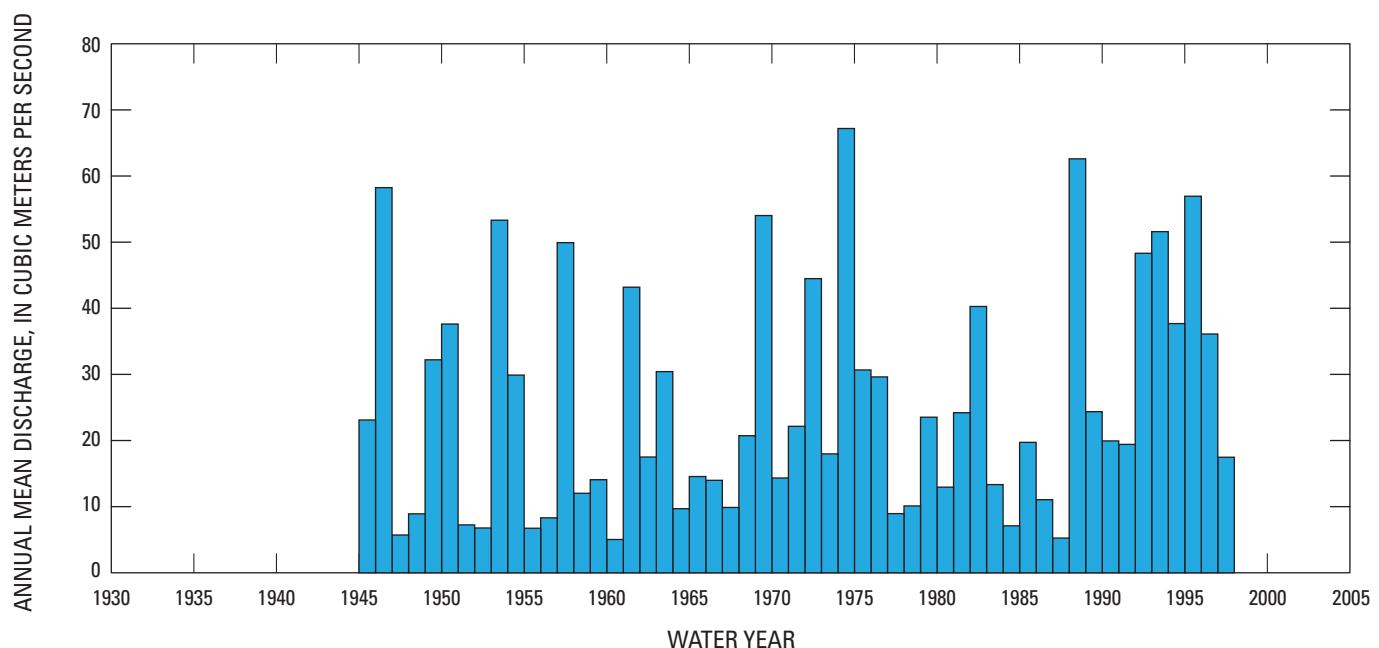

Figure 44. Annual mean discharge at streamflow-gaging station IRQ_T15, Adhaim River Injana, Iraq, water years 1945–97.

Tigris River Basin

DIYALA RIVER AT DERBENDI-KHAN (IRQ_T16)

(U.S. Geological Survey identification number: 35080004545000)

LOCATION: Latitude 35° 08' 00" N, Longitude 45° 45' 00" E.

DRAINAGE AREA: 17,800 square kilometers.

PERIOD OF RECORD: November 1931 to September 2004.

GAGE: The staff gage known as "D" gage was located on the right bank of the Diyala River 900 meters downstream of the Derbendi-Khan Dam. The gage was damaged in October 1961 and a temporary gage, gage "E," was installed 1 kilometer downstream of gage "D." In May 1975, a permanent gage was installed upstream of gage "E."

RECORDS: From gage "D" until 1961, the discharge measurements were made regularly until April 1961 and the records for that time period are considered complete. As of December 1961, the values have been taken directly from the outflow of the Derbendi-Khan Dam.

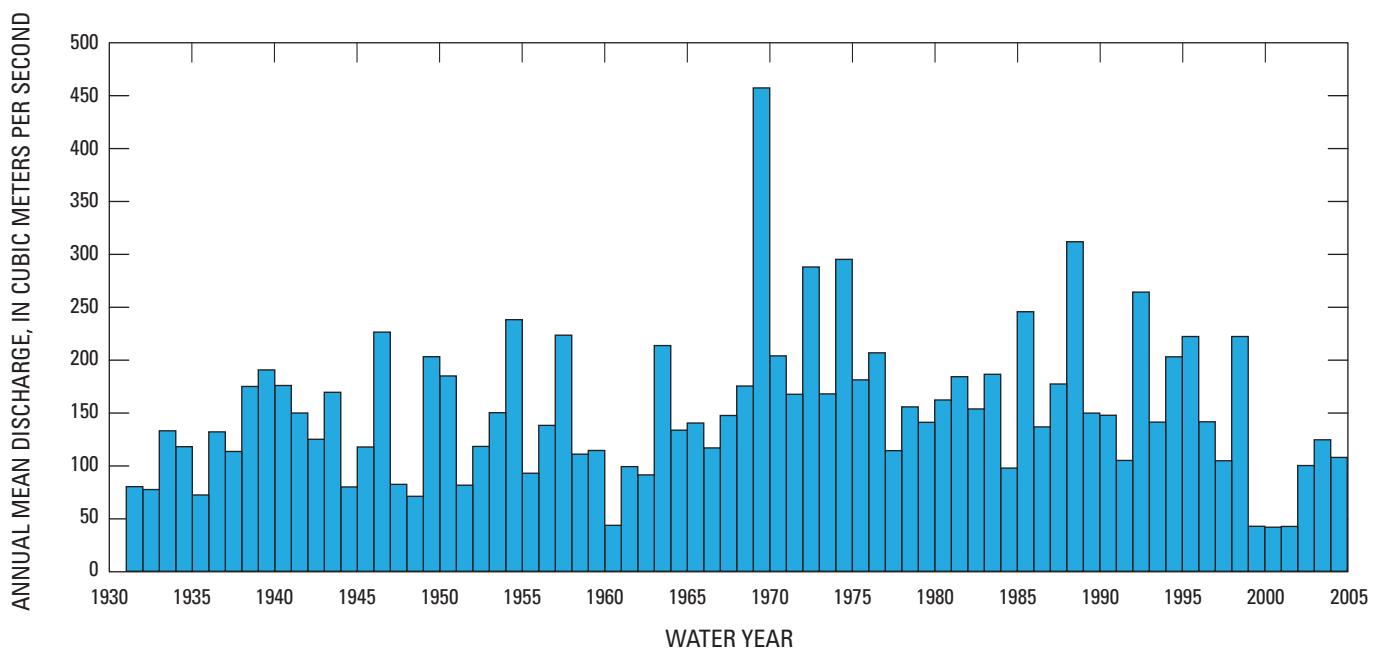

Figure 47. Annual mean discharge at streamflow-gaging station IRQ_T16, Diyala River at Derbendi-Khan, Iraq, water years 1931–2004.

Table 77. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T16, Diyala River at Derbendi-Khan, Iraq, water years 1931–2004.

[m³/s, cubic meters per second]

Tigris River Basin

DIYALA RIVER AT DISCHARGE SITE (IRQ_T17)

(U.S. Geological Survey identification number: 35060104542020)

LOCATION: Latitude 35° 06' 01" N, Longitude 45° 42' 02" E.

DRAINAGE AREA: 29,700 square kilometers.

PERIOD OF RECORD: January 1930 to September 1991.

GAGE: The staff gage at the discharge site is located on the left bank of the Diyala River 8 kilometers upstream of the Diyala Weir. The gage is set to the GTS datum. A second staff is located at the Flying Bridge 7 kilometers downstream of the discharge site.

RECORDS: Discharge measurements are considered to be good for low and medium flows and fair for high flows.

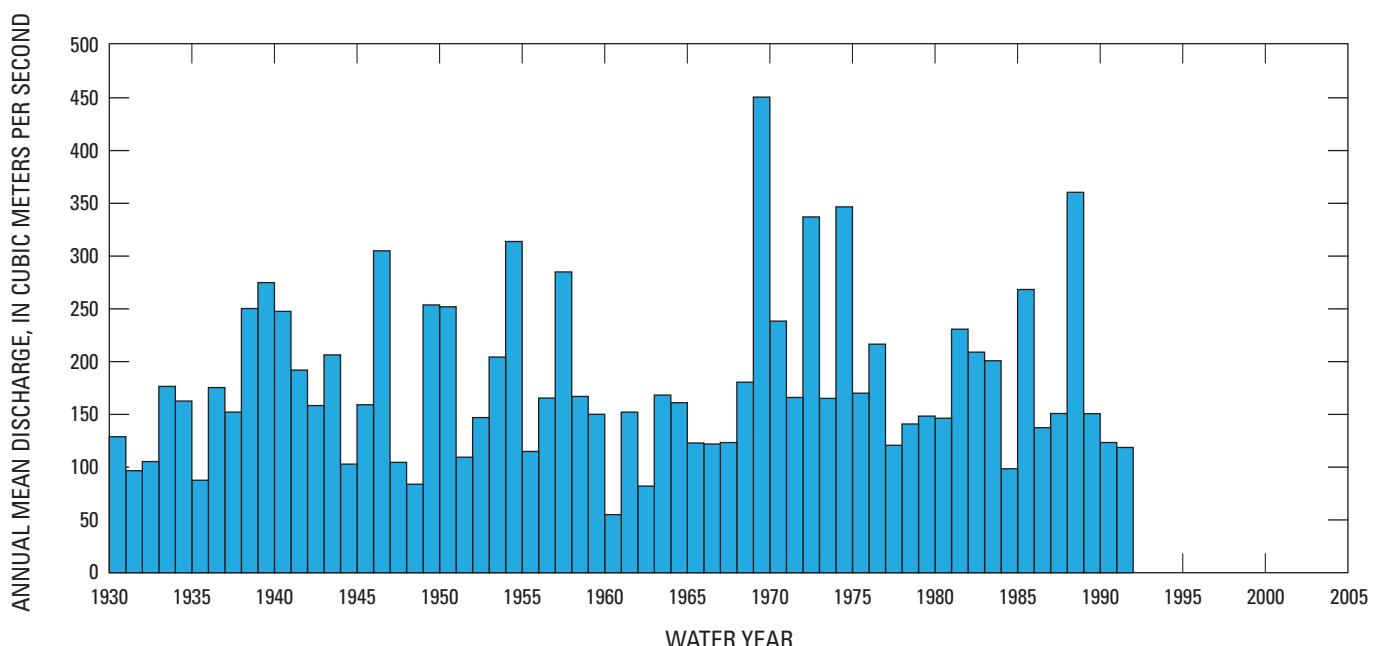

Figure 50. Annual mean discharge at streamflow-gaging station IRQ_T17, Diyala River at discharge site, Iraq, water years 1930–91.

Table 82. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T17, Diyala River at discharge site, Iraq, water years 1930–91.

[m³/s, cubic meters per second]

Tigris River Basin

TIGRIS RIVER AT BAGHDAD (IRQ_T18)

(U.S. Geological Survey identification number: 33243404420320)

LOCATION: Latitude 33° 24' 34" N, Longitude 44° 20' 32" E.

DRAINAGE AREA: 134,000 square kilometers.

PERIOD OF RECORD: March 1930 to May 2004.

GAGE: The staff gage consists of enameled iron (1 meter long) strips bolted to the vertical wall on the left bank of the Tigris River 275 meters upstream of Al-Shohada Bridge. The gage is set to GTS datum. The automatic gage also is installed at the same location and set to record gage heights as high as 30.20 meters.

RECORDS: Discharge records are missing data from October 1995 to September 2000. Discharge measurements are made frequently from a boat attached to a permanent overhead cable. Discharge measurements are excellent.

Tigris River Basin

GHARRAF CANAL (IRQ_T19)

(U.S. Geological Survey identification number: 32315504547250)

LOCATION: Latitude 32° 31' 55" N, Longitude 45° 47' 25" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: December 1940 to March 2005.

GAGE: The staff gage is located downstream of the head regulator at Kut Barrage. Discharge measurements are made regularly from a boat. The gage is set to the GTS datum.

RECORDS: Discharge records are missing data from October 1999 to September 2000, and for March 2003, November, April, July–September 2004, and December–February 2005. Discharge records are fair.

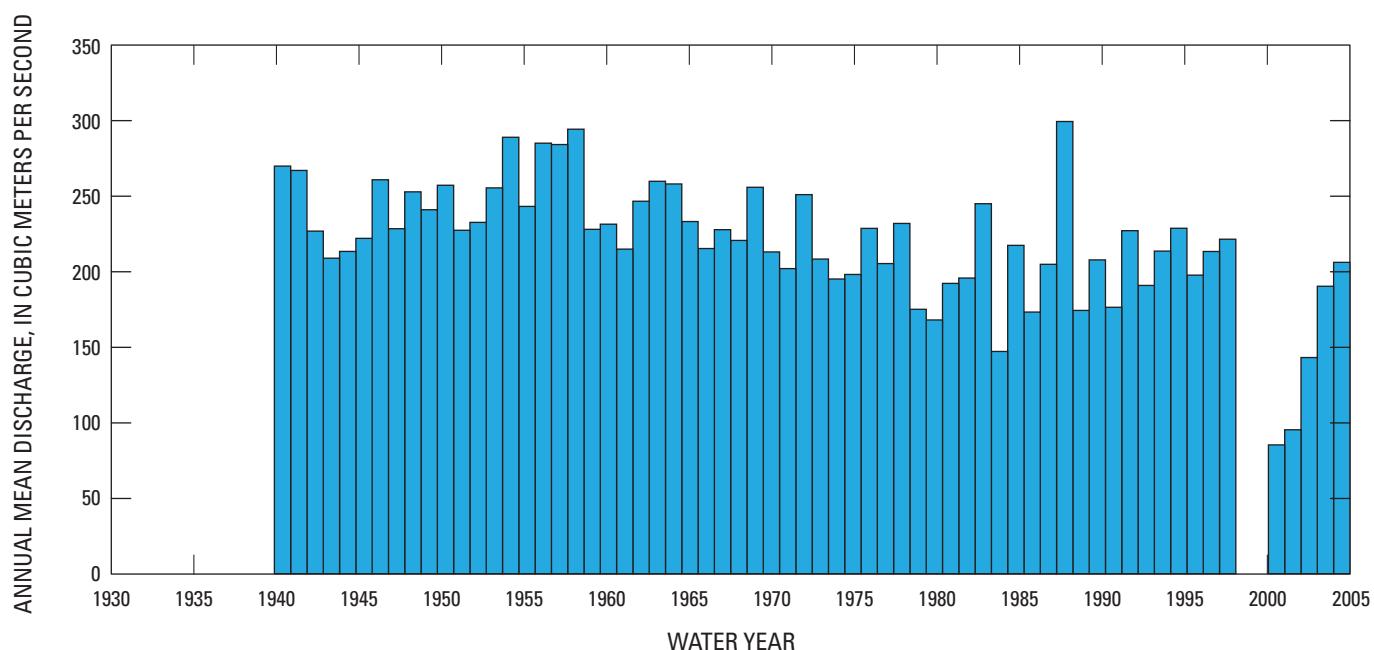

Figure 56. Annual mean discharge at streamflow-gaging station IRQ_T19, Gharraf Canal, Iraq, water years 1940–2005.

Table 92. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T19, Gharraf Canal, Iraq, water years 1940–2005.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics

Tigris River Basin

TIGRIS RIVER DOWNSTREAM OF KUT BARRAGE (IRQ_T20)

(U.S. Geological Survey identification number: 32290004550000)

LOCATION: Latitude 32° 29' 00" N, Longitude 45° 50' 00" E.

DRAINAGE AREA: 166,200 square kilometers.

PERIOD OF RECORD: October 1931 to November 2005.

GAGE: The gage known as the "Downstream Kut Barrage" is located on the wall of the navigation lock immediately downstream of Kut Barrage. The gage is set to the GTS datum.

RECORDS: Discharge records are missing data from October 1983 to September 1987. Discharge measurements are made regularly from a boat attached to a permanent overhead cable 3 kilometers downstream of Kut Barrage.

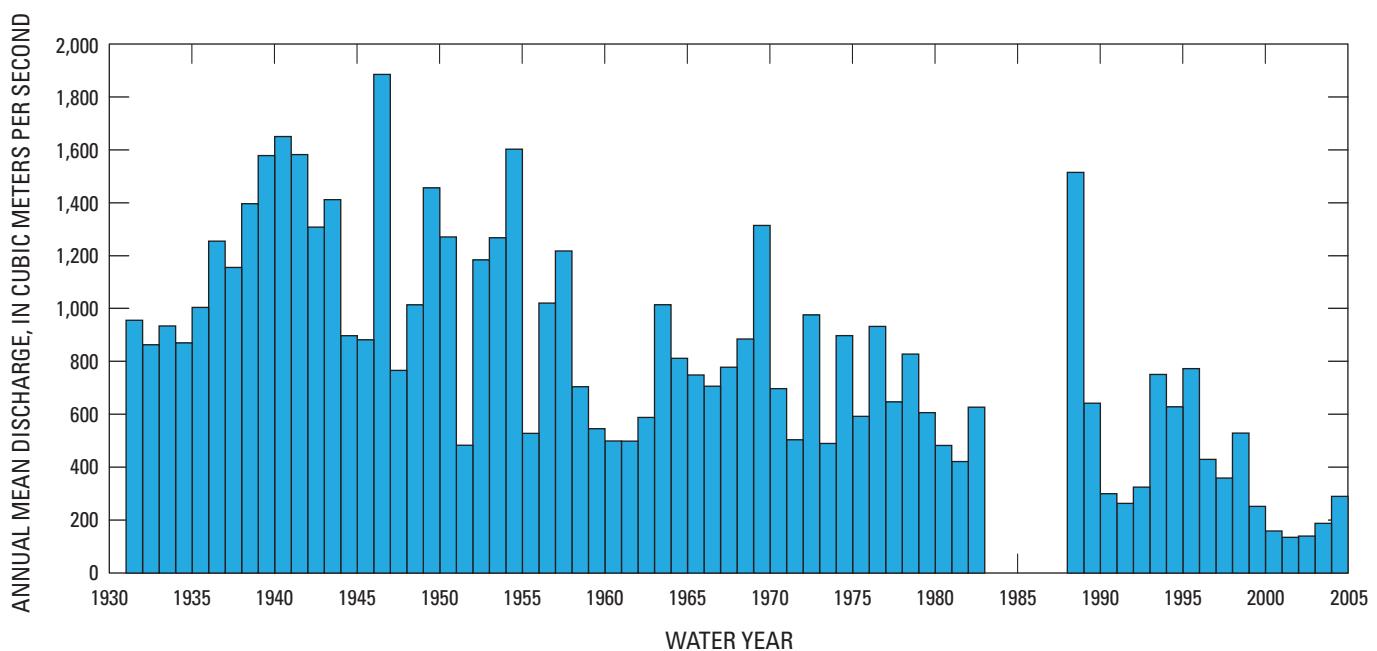

Figure 59. Annual mean discharge at streamflow-gaging station IRQ_T20, Tigris River downstream of Kut Barrage, Iraq, water years 1931–2006.

Table 97. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_T20, Tigris River downstream of Kut Barrage, Iraq, water years 1931–2006.

[m³/s, cubic meters per second]

Euphrates River Basin

EUPHRATES RIVER AT HUSAYBAH (IRQ_E1)

(U.S. Geological Survey identification number: 34252004100380)

LOCATION: Latitude 34° 25' 20" N, Longitude 41° 00' 38" E.

DRAINAGE AREA: No information available for this site.

PERIOD OF RECORD: November 1981 to September 1997.

GAGE: No information available for this site.

RECORDS: Discharge records are missing data for water year 1995.

Euphrates River Basin

EUPHRATES RIVER AT HIT (IRQ_E2)

(U.S. Geological Survey identification number: 33362304250140)

LOCATION: Latitude 33° 36' 23" N, Longitude 42° 50' 14" E.

DRAINAGE AREA: 264,100 square kilometers.

PERIOD OF RECORD: October 1932 to May 1997.

GAGE: The "1928" masonry step gage is located on the right bank of the Euphrates River 300 meters downstream of the former 1923 staff gage, which was located near Hit Sarai. The gage is set to the GTS datum.

RECORDS: Discharge records are missing data for water year 1988 (October through May, and August and September), and water year 1992. Until April 1968 when the cable was damaged, discharge measurements were made regularly by boat attached to a permanent overhead cable 3 kilometers downstream of the town of Hit. In 1973, a new cableway was installed at Hit and measurements were made regularly thereafter.

Euphrates River Basin

EUPHRATES RIVER DOWNSTREAM OF HINDIYA BARRAGE (IRQ_E3)

(U.S. Geological Survey identification number: 32430104416010)

LOCATION: Latitude 32° 43' 01" N, Longitude 44° 16' 01" E.

DRAINAGE AREA: 274,100 square kilometers.

PERIOD OF RECORD: February 1930 to September 1999.

GAGE: The staff is located on the left bank of the Euphrates River. Discharge measurements are made from a boat attached to a permanent stag line 2 kilometers downstream of Hindiya Barrage. The gage is set to the GTS datum.

RECORDS: Discharge records are missing data for water years 1987 and 1990. Discharge measurements are considered to be fair because they are affected by the operation of the barrage.

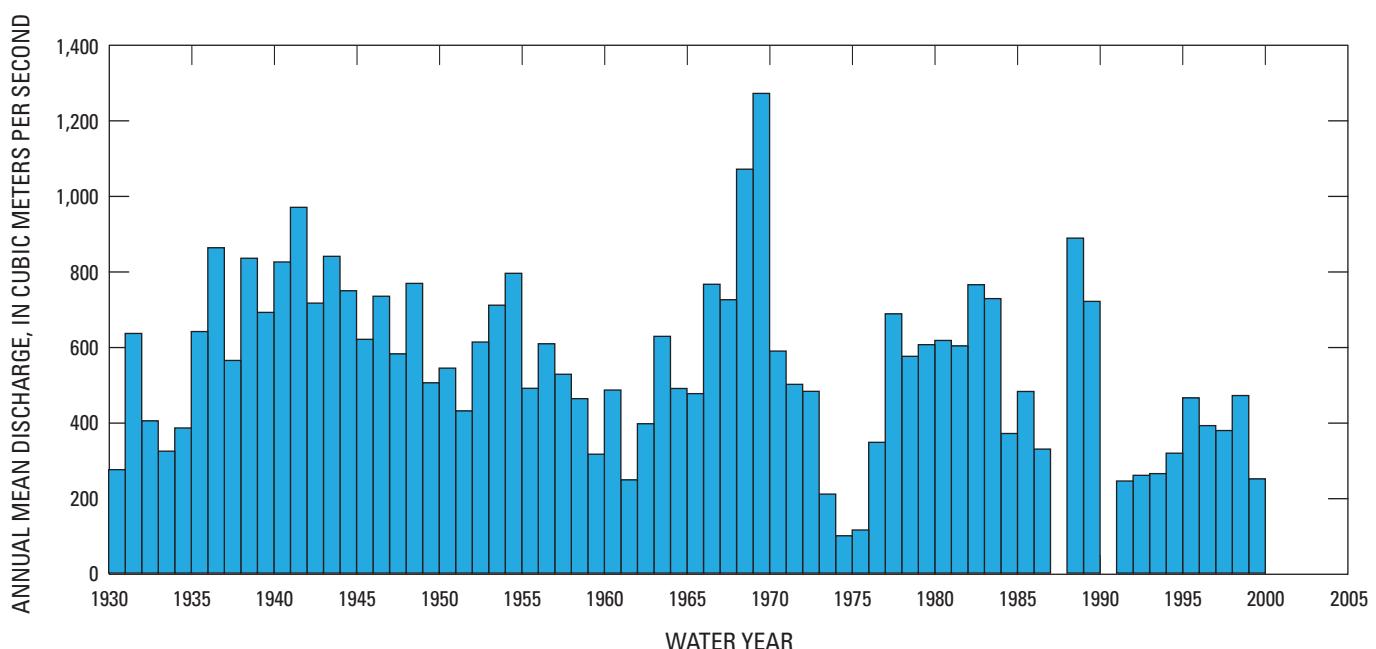

Figure 68. Annual mean discharge at streamflow-gaging station IRQ_E3, Euphrates River downstream of Hindiya Barrage, Iraq, water years 1930–99.

Table 112. Extremes and statistics for monthly and annual mean discharge at streamflow-gaging station IRQ_E3, Euphrates River downstream of Hindiya Barrage, Iraq, water years 1930–99.

[m³/s, cubic meters per second]

Month	Maximum		Minimum		Statistics			
	Discharge (m ³ /s)	Water year of occurrence	Discharge (m ³ /s)	Water year of occurrence	Mean discharge (m ³ /s)	Standard deviation (m ³ /s)	Coefficient of variation	Percentage of annual discharge

Table 115. Exceedance probability of maximum mean discharge for selected numbers of consecutive days at streamflow-gaging station IRQ_E3, Euphrates River downstream of Hindiya Barrage, Iraq, water years 1930–99.

Exceedance probability	Recurrence interval (years)	Maximum mean discharge, in cubic meters per second			
		Number of consecutive days			
		3	7	15	30
0.80	1.25	1,033.40	962.45	886.17	815.13
0.50	2	1,727.00	1,649.30	1,586.20	1,480.50
0.20	5	2,570.20	2,502.40	2,421.10	2,269.70
0.10	10	3,033.80	2,977.30	2,855.10	2,674.20
0.05	20	3,410.60	3,365.70	3,188.70	2,980.80
0.02	50	3,814.50	3,784.20	3,522.80	3,282.70
0.01	100	4,065.90	4,045.50	3,716.20	3,454.40

Table 116. Non-exceedance probability of minimum mean discharge for selected numbers of consecutive days at streamflow-gaging station IRQ_E3, Euphrates River downstream of Hindiya Barrage, Iraq, water years 1930–99.

Non-exceedance probability	Recurrence interval (years)	Minimum mean discharge, in cubic meters per second						
		Number of consecutive days						
		3	7	15	30	60	90	183
0.5	2	54.87	78.09	114.09	138.87	163.07	181.31	242.91
0.2	5	24.16	35.70	64.51	82.11	97.49	107.57	149.33
0.1	10	15.71	23.19	47.68	62.41	75.11	82.54	115.91
0.05	20	11.01	16.05	37.07	49.77	60.81	66.60	94.06
0.02	50	7.37	10.46	27.86	38.58	48.17	52.54	74.40
0.01	100	5.63	7.81	23.00	32.56	41.34	44.97	63.65

Data Considerations

The reliability of statistical data is related to the length of record for a stream. The Hydrology Subcommittee of the Interagency Advisory Committee on Water Data (1982) recommends that at least 10 years of the records be used for computing flood frequency estimates. Ordinarily, the length of record criterion for inclusion of a streamflow-gaging station is at least 10 years. However, the record length for streamflow-gaging stations in Iraq can vary substantially. The 10-year requirement was not applied to all streamflow-gaging stations, so that statistics could be computed for those stations not meeting the 10-year requirement for length of record.
